A Comprehensive Analysis Report of Emerging Technologies Adaption

Submitted By:
Mojica, John Daniel S.
BSCS - 3A

Course Subject: DCIT 26
Application Development
and
Emerging Technologies

Date Submitted:
September 12, 2026

Submitted To:
Instructor: Sir Johneros P. Puyo

September 2026

Executive Summary

Emerging technologies describe new technologies or rapidly developed innovations that are continuously evolving and still being developed. Emerging technologies also refer to those that are in the early stages of development or adaptation. In a modern-day era where technology changes significantly and quickly, businesses and government agencies have to deal with it. They need to use emerging technologies, ideas, and inventions, but they also have to be careful and watch out for big risks related to how they work and are used. This comprehensive report can guide you from theoretical to practical real-world experience. The idea is from Rotolo, Hicks, and Martin (2015), the World Economic Forum (2016), and International Business Machines Corporation (IBM), and it turns into a comprehensive report that can guide client recommendations and strategic planning. This document should create a clear way to check, use, and grow new technologies while dealing with uncertainty.

Overview of Emerging Technologies

Emerging technologies pertain to new technologies or rapidly developing innovations that are continuously evolving and developing over time. Based on a Patsnap Blog post on the internet, which is an online resource published by Patsnap, they refer to emerging technologies as technologies that are in the early stages of development or adaptation. They have the potential to significantly impact everyday life in the modern-day era.

Emerging technologies may include a range of technologies in any field we know today, such as healthcare, finance, education, etc. These include various devices, technologies, or even systems, which were developed to make people work in an easy and efficient way. This report should guide you business/es owners and government agencies, on emerging technologies and on how technology is adopted in the modern-day era. In the modern-day era, technology can also be classified into emerging technologies through its characteristics. In addition, Rotolo, Hicks, and Martin (2015) identify five main characteristics of emerging technologies and explain how they emerge, as summarized in Table 1 below.

Characteristics of an Emerging Technology

Characteristics	Description
• Radical Novelty (new)	In this kind of characteristic, emerging technology performs tasks entirely different from the technology we used to. This means that we turn old technology into brand new applications in our lives. Novelty shows progressing technology or an existing technology, but we make it, or we use it, into a different one to fulfill its

	functions. For example, the use and applications of artificial intelligence: back in the day, we only used AI like a search engine similar to Google Chrome. Now, AI is utilized by everyone in modern-day fields like healthcare, finance, companies, and even education.
• Relatively Fast Growth (speed)	The second characteristic of an emerging technology is called relatively fast growth. This characteristic refers to rapid growth, or how fast an emerging technology grows, unlike its opposite, which is non-emerging technology. Relatively fast growth accelerates fast expansion across different sectors, which includes research output, patents, prototype development, and stakeholder adoption. For example, the increasing number of people who use artificial intelligence such as corporations, education, and even us.
• Coherence (combined)	The third characteristic of an emerging technology is coherence. Coherence pertains to the convergence of formerly distinct study streams and technologies into a unified one. This is a technology that is grouped for a common purpose. In simple terms, coherence refers to the separate research concepts and tools that come together in a group to form a clear and coherent field with a shared understanding. For example, cloud + artificial intelligence + data analytics + robotics or electronics working together to form a clear, unified field with a shared identity or common purpose.
• Prominent Impact (effect)	The fourth characteristic of emerging technology is called prominent impact. In this kind of characteristic, the emerging technology gains advantages and benefits across any sector. Prominent impact causes transformations in our society and the economy. These transformations change how industries are organized. This also changes the way institutions operate. In simple terms, prominent impact refers to a change that is big enough that people can easily see or measure the changes made. For example, artificial intelligence transforms our medical field, business/es or corporate field, universities, and even our daily lives in the modern-day era.

• Uncertainty and Ambiguity (unclear)	The last characteristic of emerging technology is called uncertainty and ambiguity. Uncertainty and ambiguity, in simple terms, refer to being unclear. Means emerging technology impact lies in the future or is coming in the future, which creates uncertainty about what might happen because we cannot control what will happen in the future. For example, some systems or applications, including artificial intelligence, can't be fully finalized.
---	--

Table 1. Characteristics of an Emerging Technology

In summary, the five characteristics of an emerging technology. Which is also based on Rotolo, Hicks, and Martin 2015), radical novelty refers to being a new or repurposed technology that we use differently. Next, relatively fast growth refers to rapid development and fast adoption of technology. While coherence refers to convergence, being combined and having the same logical interconnection. Prominent impact refers to the wide-ranging benefits of any field and sectors. And for the last one, uncertainty and ambiguity refer to the fact that future outcomes of an emerging technology may still be unclear.

Figure 1. Key Characteristics of Emerging Technologies

Emerging Technology Areas

- **Augmented Reality (AR)** - Augmented reality is a type of technology that allows us to display sound, effects, and text in a user's view. In addition, according to the International Business Machines Corporation (IBM), AR refers to the real-time integration of digital information into a user's environment. Nowadays, AR is used every day in our daily lives, for example, through a device like our smartphone or smart glasses.

- **Artificial Intelligence (AI)** - Artificial intelligence is a type of technology that copies how we humans think using software-coded heuristics. The ways include how we learn, reason, and even self-correct.
 - **Machine learning** - Machine learning is the act of using artificial intelligence; this includes how computers learn on their own from the knowledge they get from the people around them. Machine learning can be seen in our daily lives in any field or sector we know, including medicine, finance, marketing, and even transportation.
- **Quantum Computing** - Quantum computers are a type of technology that uses the principles of quantum theory. This type of computer uses quantum technology to do calculations. These computers use qubits as their unit of measurement. A qubit is also similar to the standard bit, which can be 0 or 1. This means that both 0 and 1 can exist in a superposition, or happen at the same time.

Figure 2. Emerging Technologies Areas

The Fourth Industrial Revolution

The Fourth Industrial Revolution was coined by Klaus Schwab, the founder and executive chairman of the World Economic Forum. The Fourth Industrial Revolution shows the different changes between different industrial revolutions from the first industrial revolution and the fourth industrial revolution. Because of this industrial revolution, it marks a turning point in how people live, work, and connect. According to the World Economic Forum, there are four parts of the said industrial revolution:

The Fourth Industrial Revolution

First Industrial Revolution, or Industry 1.0	Industry 1.0 started in the 18th century. In this era, they started to introduce mechanical production using water and steam-powered like coal which were used in the first factories.
Second Industrial Revolution, or Industry 2.0	Industry 2.0 started in the 19th century. In this era, they started to introduce mass assembly and electricity, the breadboard era, which was used to achieve mass and more production.
Third Industrial Revolution, or Industry 3.0	Industry 3.0 started in the early 2000s. Early 2000s started to introduce computers and the boom of information technology, automation which was used to access the internet.
Fourth Industrial Revolution, or Industry 4.0	Industry 4.0 or the modern-day era that it is still being developed. In this current era, emerging technologies like the Internet of Things (IoT), robotics and electronics, virtual and augmented reality, and even artificial intelligence were used to develop and create cyber-physical systems to make people work easier and efficiently.

Table 2. The Fourth Industrial Revolution

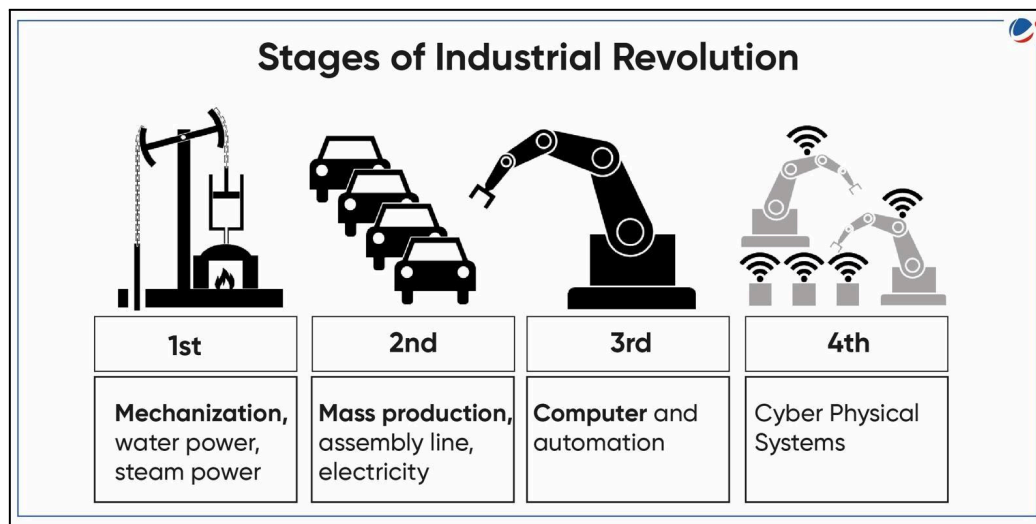

Figure 3. The Fourth Industrial Revolution (Stages of Industrial Revolution)

Building Blocks of Industry 4.0 Integration

- Big Data Analytics** - This refers to advanced progress getting, arranging, and examining massive datasets to uncover hidden patterns and guide decisions. In addition, according to the International Business Machines Corporation (IBM) Big

Data Analytics refers to the systematic processing and analysis of large amounts of data and information, known as the big data, to extract valuable insights. These patterns immediately get answers from customers and help make production lines run better.

- **Internet of Things (IoT)** - Internet of Things refers to physical objects embedded with sensors, software, and wireless technologies. Everyday physical objects are connected to the internet. These physical objects are connected to each other and can exchange information with each other, other devices, and even systems over local networks.
- **Cloud Computing** - Cloud computing refers to the delivery of different services through the Internet. In addition, cloud computing does the remote services, data information-driven production, and has fast reaction times. This includes tools and services like data storage, servers, databases, networking, and software.
- **Augmented Reality (AR)** - Augmented Reality in Industry 4.0 Technologies acts as a critical human-machine interface. AR overlay digital data information directly onto the physical workspace. While workers work with hands-free tools that show visual information, about how to do tasks. This helps them reduce mistakes in assembly, fixing things in the field, and real-time data is the driving force behind their fast decision-making.

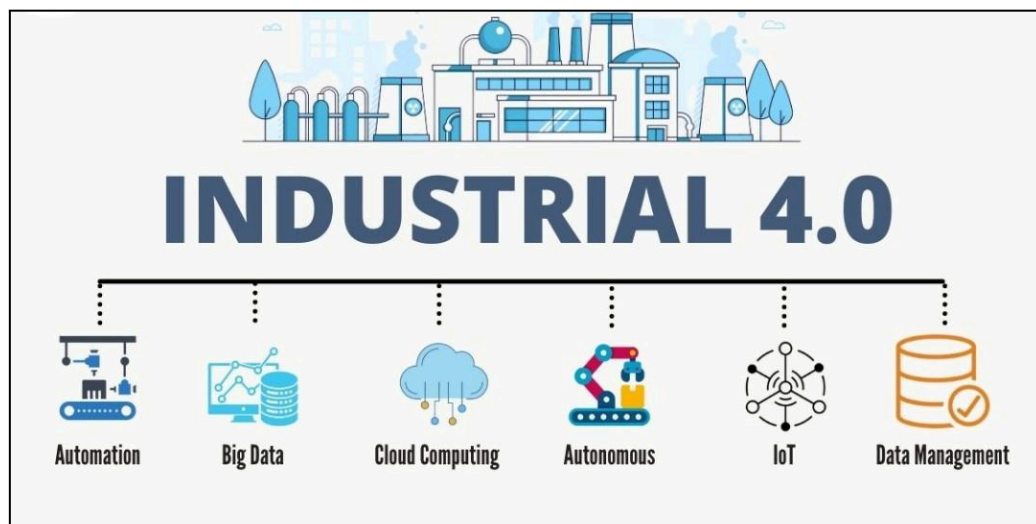

Figure 4. Building Blocks of Industry 4.0 Integration

Conclusion and Recommendation

In conclusion, emerging technologies refer to new technologies or rapidly developing innovations that are continuously evolving and developing over time. In addition, emerging technologies are described as technologies that are in the early stages of development or adaptation. Emerging technologies may bring changes or give rise to new but they can also

bring uncertainty and unclear details. A balanced, careful, and studied in an organized way is needed when you adapt to emerging technologies.

While a business only sees emerging technology as just a software upgrade, it may create problems in operations and, worst of all, waste money. You may have long-term advantages and benefits that can come from emerging technologies, including the use of augmented reality, artificial intelligence, machine learning, quantum computers, big data analytics, and the Internet of Things. For my recommendation, if you are a business owner, only adopt emerging technologies after you and your business conduct a study if it's adoptable and can be enabled for your business. For government agencies on technology adoption, I think you should prioritize upgrading your devices, systems, and applications first. Before going to emerging technologies, I think your devices, systems, and applications may or may not be compatible with the technology. After that upgrade, you can now make a study whether it's adoptable and can be enabled for your respective agencies in the modern-day era. After reading all of the content of this comprehensive report this/you can now guide client recommendations and strategic planning for emerging technologies.

Photo Documentation (AI Checker result and Grammarly result)

The collage displays six screenshots of AI detection and grammar checking results for a document titled "Emerging Technologies Guide". The screenshots are arranged in a 3x2 grid. Each row shows a different version of the text being analyzed.

Row 1 (Top):

- Scribbr AI Detector:** Shows 0% AI-generated text. The text describes emerging technologies as continuously evolving and still being developed, referring to those in the early stages of development or adaptation. It mentions that in a modern-day era, technology changes significantly and quickly, and businesses and government agencies have to deal with it. It also mentions that they need to use emerging technologies, ideas, and inventions, but they also have to be careful and watch out for big risks related to how they work and are used. The text is 147 words long.
- Grammarly:** Shows a writing quality score of 92. The text is the same as in the Scribbr screenshot. The Grammarly interface shows a "Verb problem check" section.

Row 2 (Middle):

- Scribbr AI Detector:** Shows 0% AI-generated text. The text describes emerging technologies as continuously evolving and developing over time. It mentions that based on a PatSnap Blog post on the internet, which is an online resource published by PatSnap, they refer to emerging technologies as technologies that are in the early stages of development or adaptation. They have the potential to significantly impact everyday life in the modern-day era. The text is 169 words long.
- Grammarly:** Shows a writing quality score of 83. The text is the same as in the Scribbr screenshot. The Grammarly interface shows a "Great job" message and "There are no more suggestions".

Row 3 (Bottom):

- Scribbr AI Detector:** Shows 0% AI-generated text. The text describes emerging technologies as continuously evolving and developing over time. It mentions that based on a PatSnap Blog post on the internet, which is an online resource published by PatSnap, they refer to emerging technologies as technologies that are in the early stages of development or adaptation. They have the potential to significantly impact everyday life in the modern-day era. The text is 96 words long.
- Grammarly:** Shows a writing quality score of 83. The text is the same as in the Scribbr screenshot. The Grammarly interface shows a "Great job" message and "There are no more suggestions".

Emerging Technologies Guide

The second characteristic of an emerging technology is called relatively fast growth. This characteristic refers to rapid growth, or how fast an emerging technology grows, unlike its opposite, which is non-emerging technology. Relatively fast growth accelerates fast expansion across different sectors, which includes research output, patents, prototype development, and stakeholder adoption. For example, the increasing number of people who use artificial intelligence such as corporations, education, and even us.

In conclusion, emerging technologies refer to new technologies or rapidly developing innovations that are continuously evolving and developing over time. In addition, emerging technologies are described as technologies that are in the early stages of development or adaptation. Emerging technologies may bring changes or give rise to new but they can also bring uncertainty and unclear details. A balanced, careful, and studied in an organized way is needed when you adapt to emerging technologies.

While a business only sees emerging technology as just a software upgrade, it may create problems in operations and, worst of all, waste money. You may have long-term advantages and benefits that can come from emerging technologies, including the use of augmented reality, artificial intelligence, machine learning, quantum computers, big data analytics, and the Internet of Things. For my recommendation, if you are a business owner, only adopt emerging technologies after you and your business conduct a study if it's adoptable and can be enabled for your business. For government agencies on technology adoption, I think you should prioritize upgrading your devices, systems, and applications first. Before going to emerging technologies, I think your devices, systems, and applications may be compatible with the technology.
